# **Flask-Simon Documentation**

***Release 0.1.0***

**Andy Dirnberger**

January 21, 2013

# **CONTENTS**

Simon is a library to help make working with MongoDB easier. Flask-Simon was created to make it even easier to use Simon with your Flask applications.

# INSTALLATION

To install the latest stable version of Flask-Simon:

```
$ pip install Flask-Simon
```

or, if you must:

```
$ easy_install Flask-Simon
```

To install the latest development version:

```
$ git clone git@github.com:dirln/Flask-Simon.git
$ cd Flask-Simon
$ python setup.py install
```

In addition to Flask-Simon, this will also install:

- Flask (0.8 or later)
- PyMongo (2.1 or later)
- Simon

# QUICKSTART

After installing Flask-Simon, import it where you create your Flask app.

```
from flask import Flask
from flask.ext.simon import Simon

app = Flask(__name__)
Simon(app)
```

`Simon` will establish a connection to the database that will be used as the default database for any `Model` classes that you define.

# CONFIGURATION

`Simon` looks for the following in your Flask app's configuration:

MONGO_URI	A MongoDB URI connection string specifying the database connection.
-----------	---

If the `MONGO_URI` configuration setting is not present, `Simon` will connect to `localhost` and use a database named after the Flask app.

# API

```
class flask_simon.Simon (app=None)
```

Automatically creates a default connection for Simon models.

```
    init_app (app)
```

Initializes the Flask app for use with Simon.

This method will automatically be called if the app is passed into `__init__()`.

**Parameters** `app` (`flask.Flask`) – the Flask application.

```
flask_simon.get_or_404 (model, *qs, **fields)
```

Finds and returns a single document, or raises a 404 exception.

This method will find a single document within the specified model. If the specified query matches zero or multiple documents, a 404 Not Found exception will be raised.

**Parameters**

- `model` (`simon.Model`) – the model class.
- `*qs` (`simon.query.Q`) – logical queries.
- `**fields` (`kwargs`) – keyword arguments specifying the query.

Full details of how to use `get_or_404()` can be found in the [Simon API](#).
